

Computer

A computer is machine that can accept data. It can process the data and give the results.

A computer system consists of two parts: hardware and software. Hardware is any part that we can see and touch. Software consists of the programs that tell the computer what to do.

There are three basic hardware sections: the CPU, main memory and peripherals. CPU is the brain of a computer and peripherals consists of input and output devices like keyboard, mouse, monitor, and printer.

Q. Complete the information tree using the paragraph.
